

JDH SOLUTIONS - SPACE PLANNING TRAINING

The training fee covers JDH time and expenses and for the flat fee up to four students may attend on the day. Training takes place at client premises – we come to you – and the course uses generic training material so that trainees can practice the topics. All students require licensed software installed on their laptops.

Questions pertaining to client's own categories will be answered wherever possible but it is unworkable to tailor tuition to specific categories.

The course duration may vary a little according to student level of knowledge of the JDA Software but is normally completed in two days which makes the training less intense and more effective. A one day course is possible but some analytical elements may be left out and other topics may be covered in less detail. We really recommend that two days is more beneficial and a better investment.

We ask that you provide a room with a projector or screen if possible - we can supply our own projector if one is not available. Students are requested to remember to bring power supplies for their laptops and sufficient power sockets need to be available within the training room.

Day 1 - This day of basics gives the student a firm grounding in the software and enables them to create, edit and output planograms with images where available. Day one training may be run back to back with day two or a gap of a week or two may allow the student to practice what they have learnt.

Topics Covered

General Overview of Spaceplanning

Before you start

Software Screen Tour

Settings Menu

Space Planning Hierarchy

Building fixture and Fixture Libraries

Create & manipulate Products

Basic Labels

Manipulating Segments

Product Masters & Product Libraries

Images

POS Elements

Printing

Day 2 - The topics covered here build on the basic knowledge already learned and teach the student the tools to work efficiently, interrogate the planogram and customise outputs.
